

# Kilts and CAS Extended

**Session 267**

**11:00am – 12:00pm**

**Sat 8 March 2014**

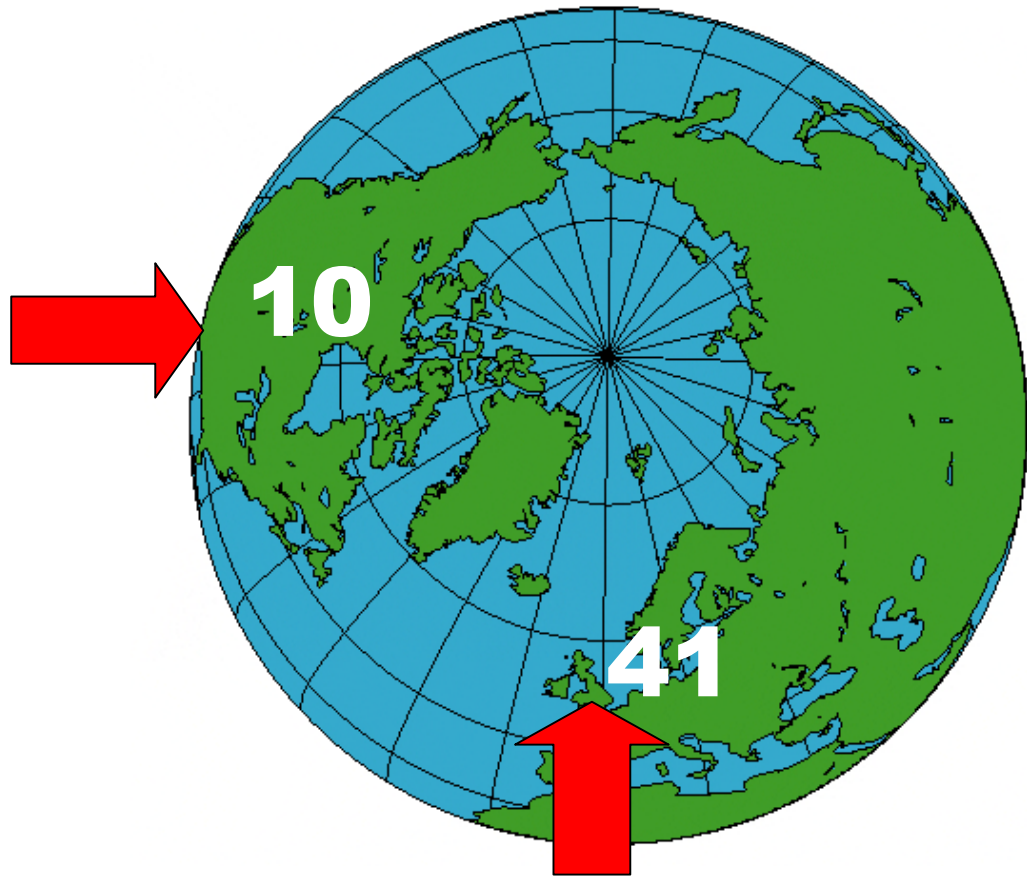

**Tropical G  
Rio Hotel and Casino**

**Nevil Hopley**

**T<sup>3</sup> National Trainer, Scotland & UK.  
Head of Mathematics Department.**

[www.calculatorsoftware.co.uk/nspire](http://www.calculatorsoftware.co.uk/nspire)

# Nevil's from 4936 miles away on a Bearing of 033°

**Strictly Limited Offer of Tartan  
TI-Nspire CX Cases at the end of this talk.**

# **This talk will have a....**

## **A Beginning**

Background information about me & CAS, and the remit of this talk.

## **A Middle**

Activities, Documents, Functions & Programs covering 7 different maths topics for students aged 12-18 years.

## **An End**

Just before 12 noon!

**And you can download all that you see today from**

**[www.calculatorsoftware.co.uk/nspire](http://www.calculatorsoftware.co.uk/nspire)**

## Kilts & CAS Talks @ T3 International Conferences

- 2011 My first 18 months of CAS usage
- 2012 The next 12 months of CAS usage
- 2013 Co-presented with Fred Ferneyhough
- 2014 Building CAS dependent functions & programs

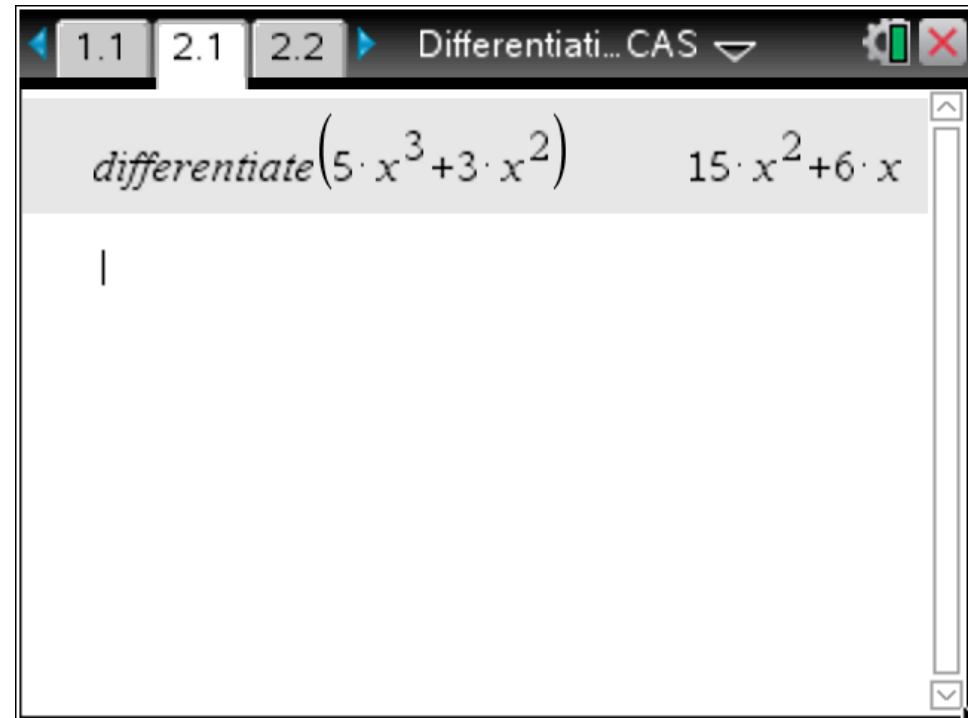

# Differentiation CAS.tns

## The Issue

A screenshot of a CAS interface window titled "Differentiati... CAS". The window has tabs for "1.1", "2.1", and "2.2". The main area displays the mathematical expression  $\frac{d}{dx}(5 \cdot x^3 + 3 \cdot x^2)$  on the left and the result  $15 \cdot x^2 + 6 \cdot x$  on the right. Below the expression is a vertical cursor bar.

## Much Nicer!

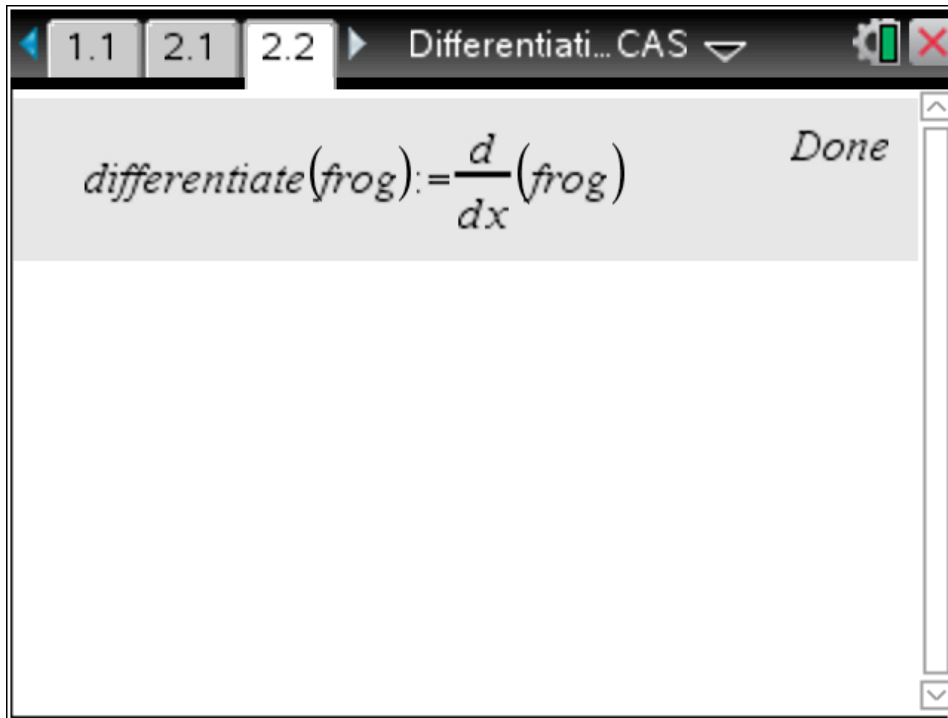

A screenshot of a CAS interface window titled "Differentiati... CAS". The window has tabs for "1.1", "2.1", and "2.2". The main area displays the text *differentiate*(5 · x<sup>3</sup> + 3 · x<sup>2</sup>) on the left and the result 15 · x<sup>2</sup> + 6 · x on the right. Below the text is a vertical cursor bar.

# Differentiation CAS.tns

## The Function

## Notes

The screenshot shows a window titled "Differentiati... CAS" with tabs for 1.1, 2.1, and 2.2. The main area displays the command  $\text{differentiate}(\text{frog}) := \frac{d}{dx}(\text{frog})$  and the word "Done" in the top right corner of the window.

'frog' is a dummy variable. It can be anything, but not a system command.

Limitation: no detection of the variable that's being differentiated with respect to. It's assumed to be  $x$ .

# Sim Equations Toolkit CAS.tns

## The Issue

1.1 \*Unsaved

$x+2 \cdot y=12$	$x+2 \cdot y=12$
$3 \cdot x-4 \cdot y=15$	$3 \cdot x-4 \cdot y=15$
$2 \cdot (x+2 \cdot y=12)$	$2 \cdot (x+2 \cdot y)=24$
$\text{expand}(2 \cdot (x+2 \cdot y)=24)$	$2 \cdot x+4 \cdot y=24$
$(3 \cdot x-4 \cdot y=15)+(2 \cdot x+4 \cdot y=24)$	$5 \cdot x=39$

## Much Nicer!

1.1 1.2 1.3 Sim Equatio... CAS

© This page shows an example of its use

$x+2 \cdot y=12$	$x+2 \cdot y=12$
$3 \cdot x-4 \cdot y=15$	$3 \cdot x-4 \cdot y=15$
$\text{multiplyby2}(x+2 \cdot y=12)$	$2 \cdot x+4 \cdot y=24$
$\text{add}(3 \cdot x-4 \cdot y=15, 2 \cdot x+4 \cdot y=24)$	$5 \cdot x=39$

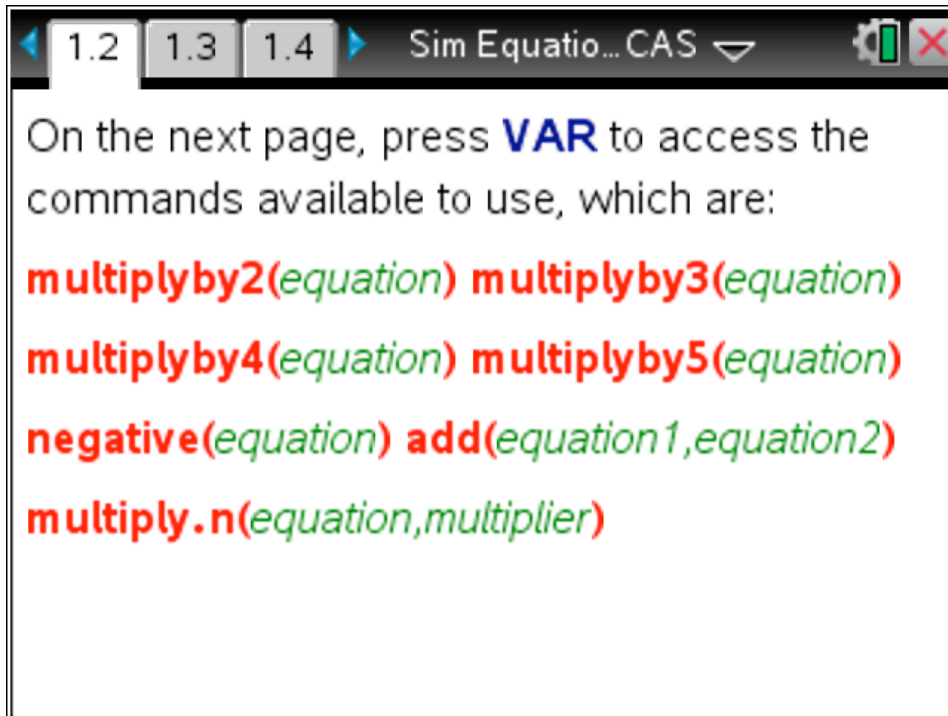

© ... and then solve this as normal.

# Sim Equations Toolkit CAS.tns

## The Functions

## Notes

Go to pages 1.7 and 1.8 to view the underlying functions.

Ungroup each of these pages by pressing **CTRL** then **6**

# Solving Linear Inequations CAS.tns

## The Issue

```
© Press ENTER, then make the following  
read as x<....  
  
12>x+10                12>x+10  
  
(12>x+10)-10          2>x  
  
x<2                    x<2  
  
|
```

## Much Nicer!

```
© Press ENTER, then make the following  
read as x<....  
  
12>x+10                12>x+10  
  
(12>x+10)-10          2>x  
  
swap(2>x)              x<2  
  
check(x<2)           "Inequation solved for x."
```

# Solving Linear Inequations CAS.tns

## The Functions

page 1.2

**swap**(*expr*)

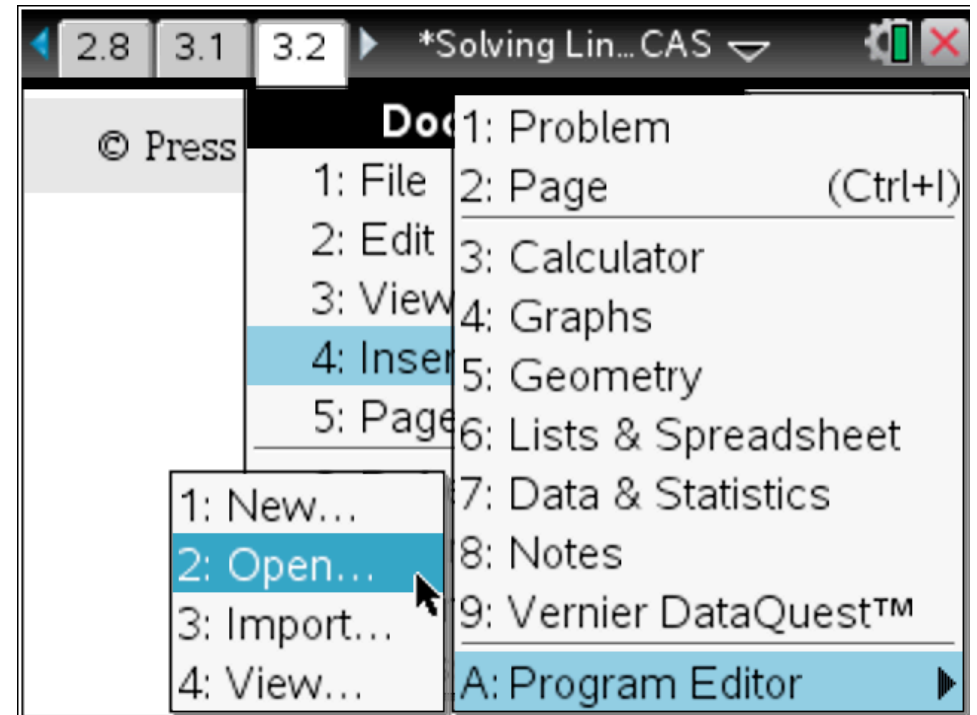

page 1.3

**check**(*expr*)

page 3.1

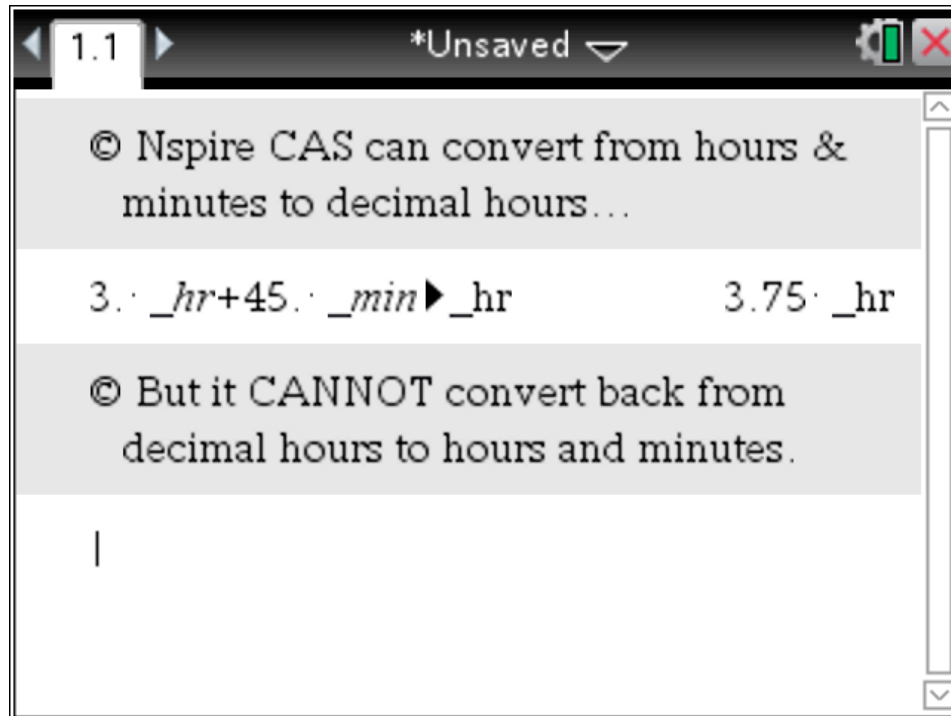

**randominequation**()

## Notes

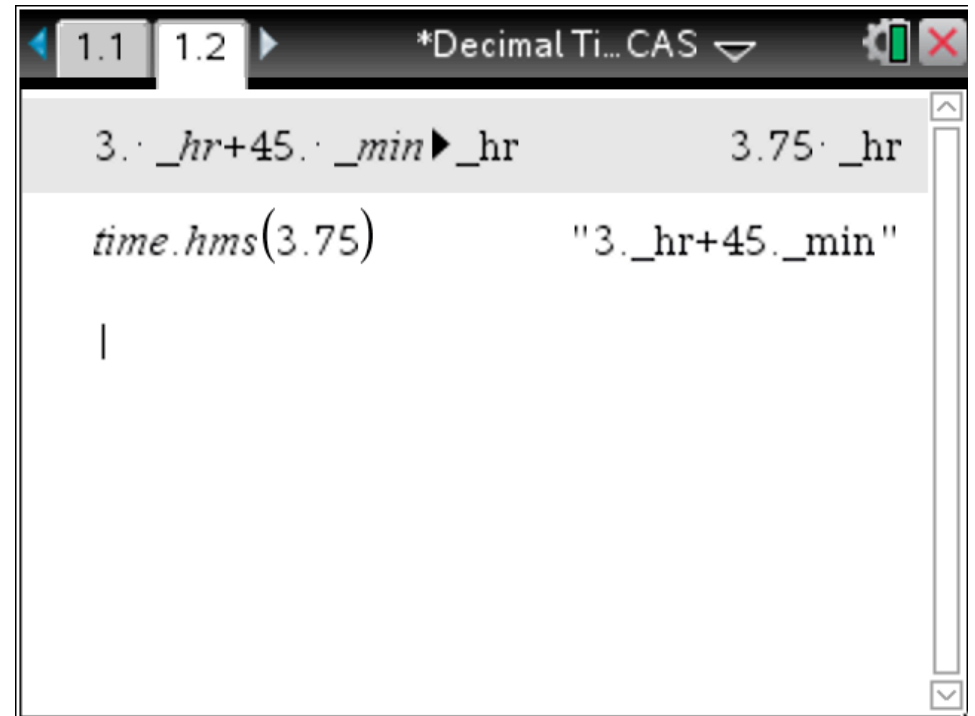

# Decimal Time CAS.tns

## The Issue

## Much Nicer!

# Decimal Time CAS.tns

## The Function

## Notes

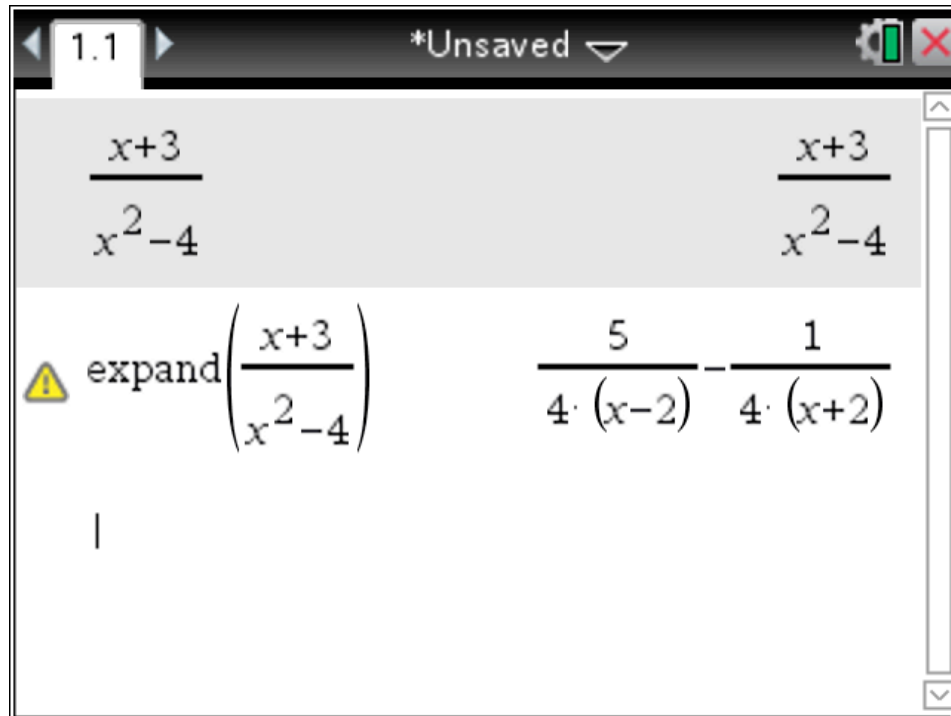

```
time.hms 0/6
Define time.hms(time)=
Func
Local h,m,s,t
h:=iPart(time)
t:=60·fPart(time)
m:=iPart(60·fPart(time))
s:= $\begin{cases} 0, & m=t \\ \text{round}(60 \cdot (t-m), 2), & m \neq t \end{cases}$ 
Return  $\begin{cases} \text{string}(h) \& \text{"\_hr"} \& \text{string}(m) \& \text{"\_min"}, & s=0 \\ \text{string}(h) \& \text{"\_hr"} \& \text{string}(m) \& \text{"\_min"} \& \text{string}(s) \& \text{"\_s"}, & s>0 \end{cases}$ 
EndFunc
```

Piecewise functions are used instead of lots of 'if' statements

Text strings were needed at the end to prevent auto evaluation of the answer back to the original form!

# Partial Fractions Checker CAS.tns

## The Issue

1.1 \*Unsaved

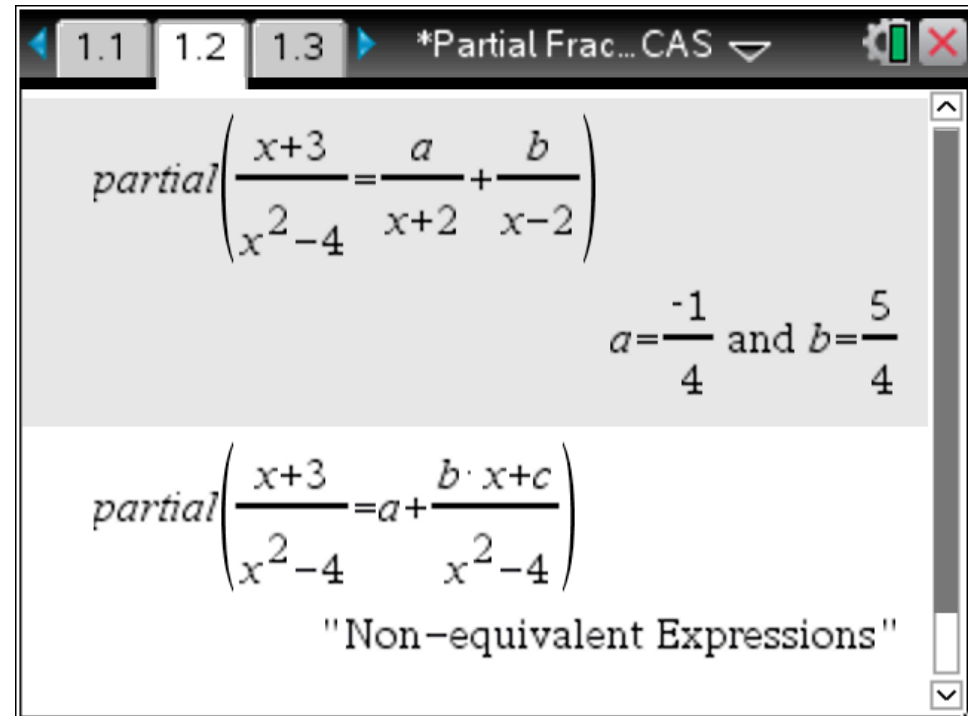

$$\frac{x+3}{x^2-4}$$
$$\frac{x+3}{x^2-4}$$

⚠ expand  $\left(\frac{x+3}{x^2-4}\right)$

$$\frac{5}{4 \cdot (x-2)} - \frac{1}{4 \cdot (x+2)}$$

|

## More Helpful?

1.1 1.2 1.3 \*Partial Frac...CAS

$$\text{partial} \left( \frac{x+3}{x^2-4} = \frac{a}{x+2} + \frac{b}{x-2} \right)$$
$$a = \frac{-1}{4} \text{ and } b = \frac{5}{4}$$
$$\text{partial} \left( \frac{x+3}{x^2-4} = a + \frac{b \cdot x + c}{x^2-4} \right)$$

"Non-equivalent Expressions"

# Partial Fractions Checker CAS

## The Function

## Brief Notes

```
Define partial(expression)=  
Func  
Local lhslist,rhslist,eqstr,varlist,i,str  
polyCoeffs(getNum(comDenom(left(expression))),x) → lhslist  
polyCoeffs(getNum(comDenom(right(expression))),x) → rhslist  
{ [] } → varlist  
"[]" → eqstr  
If dim(lhslist)=dim(rhslist) Then  
varlist[1]:=expr(right(string(rhslist[1]),1))  
© previous line finds just one of the variables used  
For i,1,dim(lhslist)  
eqstr&string(lhslist[i])&"="&string(rhslist[i])&" and " → eqstr  
EndFor  
left(eqstr,dim(eqstr)-5) → eqstr  
"solve("&eqstr&","&string(varlist)&)" → str  
Return expr(str)  
Else  
Return "Non-equivalent Expressions"  
EndIf  
EndFunc
```

Separate LHS and RHS of expression to establish coeffs of each polynomial.

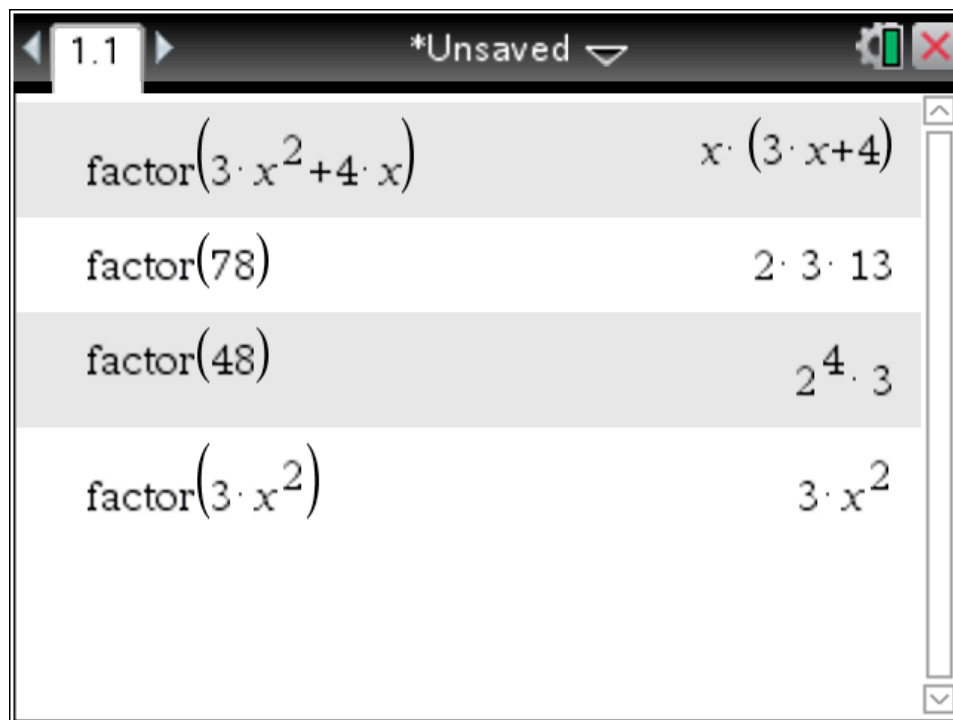

If they are equivalent powers, then pick just one of the variables used, for use later with the **solve**( command.

Cycle through the polynomials' coefficients, equating corresponding coeffs and building up an expression to then solve

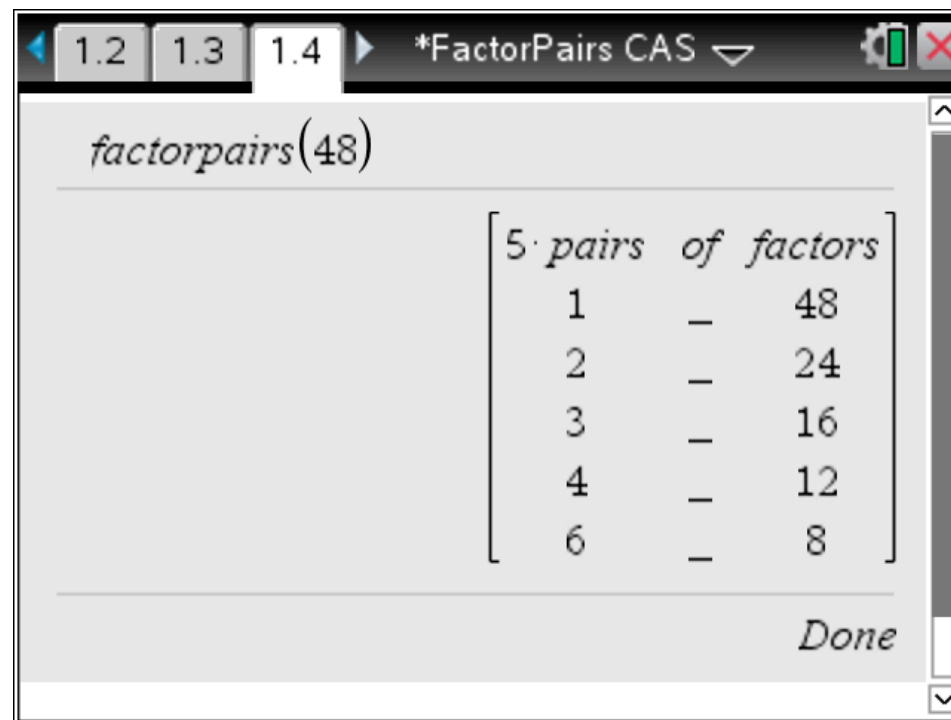

If powers were not equivalent, then return error message.

Phew!

# FactorPairs CAS.tns

## Broad Description of How It Works ...

- Find all the single letter variables in the entered expression, using the zeros command and set them all up in a matrix.
- Find all the powers of each variable and record them in the 2<sup>nd</sup> row of the matrix.
- Find the value of any constant coefficient, by setting all the variables to have value 1.
- Find all the integer factors of the constant, from 1 up to  $\sqrt{\text{constant}}$  and store them in the list called *cfactors*.
- Construct the first factorpair using the first member of *cfactors* and all the variables from the matrix with each of their powers initially set to 0 (call it *term1*) and dividing the entered term by it, to give *term2*.
- Cycle through the members of *cfactors* and each of the variables in the matrix, increasing their powers in turn, up to their maximums. Then 'reset' each power and move onto the next variable.
- Closing commands adjust the phrasing of the output if there was only one factorpair for the entered expression.
